

SOFTINVITES

Business & Functional Requirements, and Product Evolution

A Product Management / Business Analysis Case Study

Original BRD/FRD: June 2024 • Case Study Update: 2026

About This Document

This document brings together the original SoftInvites Business Requirements Document (BRD) and Functional Requirements Document (FRD) with the product features and changes that emerged during implementation and operational use. It serves two purposes: a product documentation record, and the foundation for a professional Product Owner / Business Analyst portfolio case study.

Part A and Part B reproduce the original requirements in full, tidied for readability and consistent table formatting. Part C documents how the product evolved beyond that original specification. Part D packages the material for portfolio use.

1. Product Overview

SoftInvites is an event and guest management platform designed to support the event lifecycle from event setup and guest management through invitation distribution, RSVP collection and venue check-in. The original specification described a broader guest-management product centred on unique QR codes, guest-list management and event administration. The current product has evolved into an internal Admin Portal with event management, guest operations, RSVP management, multichannel communication and reporting capabilities.

PART A — Original Business Requirements Document (BRD)

Dated June 2024. SoftInvitesQR was specified as a guest management application for generating and sending QR codes to registered guests. It enables users to upload guest lists and customise guest details, generating unique one-time codes. It was designed to serve events worldwide, on the web and mobile-responsive.

A.1 Objectives

To create a secure and seamless event guest management experience for event organisers and guests.

A.2 MVP Scope

- The system should be able to bulk-generate unique QR codes for guests by importing a guest list into the system.
- QR codes should be one-time-entry only, and the system should indicate when a code has been used.
- Admins should be able to export QR codes as PNG files and send them to guests through any channel, specifically email and WhatsApp.
- The system should generate an analysis of how codes were scanned, exportable to share with the client.
- The system should be able to scan the QR codes it generates.

A.3 Proposed Business Process

- The web-based application should be easy to navigate.
- Event registration should be simple, friendly and uncomplicated; users should be able to create events with minimal friction.
- New users must register on first use and create a profile with a valid email address, or sign up via Google or Facebook, before accessing SoftInvitesQR.
- On login, the landing page is a splash screen that displays a “Create Event” icon.
- Users should be able to remove and replace linked devices on their account at any time.

A.4 Requirement Prioritisation Key

Requirements throughout the original FRD (Part B) were prioritised using the scale below.

Rating	Description
1 - Critical	Critical to the usability of the app; the project is not viable without it.
2 - High	High priority; the project cannot be implemented without it.
3 - Medium	Important — the project can proceed and the app will function without it, but it is needed for completeness.
4 - Low	Low priority / “nice to have” if time and budget permit.
5 - Future	Out of scope for this phase; recorded here as a candidate for a future release.

PART B — Original Functional Requirements Document (FRD)

The tables below reproduce the full original functional specification (June 2024), grouped by functional area and lightly edited for clarity, spelling and consistent table formatting. No requirements have been added or removed — only the presentation has been cleaned up.

Req #	Priority	Requirement	Business Case
Platform Access & Sign-Up			
SIBSF001	High	SoftInvitesQR must be accessible on laptops and on Android and iOS devices.	Users are expected to use the app on laptops, Android and iOS, and to scan codes from mobile or laptop.
SIBSF002	High	SoftInvitesQR is also delivered as a web-based application.	Gives users access to SoftInvitesQR from a computer or desktop.
SIBSF003	High	Sign-in requires full name, email address and password. Passwords must include an uppercase letter, a lowercase letter and a symbol.	Enables users to open an account on the web app.
SIBSF004	High	Users should be able to sign up using a Google account.	Core to the SoftInvitesQR sign-up experience.
SIBSF004a	High	The dashboard should display total events created, total guests, and total used / unused access codes.	Same as above.
SIBSF005	High	The left-hand navigation should display Dashboard, Event, Profile and Change Password.	Same as above.
SIBSF007	High	The Event screen should show “New Event” and “Delete All Events” buttons, a search panel, and columns for event name, location, date created, description, status and actions.	Same as above.
SIBSF008	High	When expanded, “New Event” should offer “Import List” and “Add Guest” actions.	Same as above.
SIBSF009	High	The guest form should capture first name, last name, phone number and email; name is a required field.	Improves the overall user experience.
Guest Categorisation & QR Generation			
SIBSF010	Medium	Users should be able to create guest-list categories (e.g. bride’s family, groom’s family).	Improves the overall user experience.
SIBSF011	Medium	Users should be able to add labels to each guest (e.g. table number, gift type).	Same as above.
SIBSF012	High	Users should be able to bulk-generate QR codes for the full list, by category, or for individual guests.	Same as above.
SIBSF013	High	The label shown beneath a guest’s QR code should be able to be hidden or unhidden after the code is generated.	A core differentiating feature of SoftInvitesQR.
SIBSF014	High	Each generated code must be unique to its guest.	Same as above.
SIBSF015	High	Users should be able to change the QR code colour, including picking colours from the imported invitation artwork.	Same as above.
SIBSF016	High	Users should be able to import invitation artwork and embed the QR code into it.	Improves the overall user experience.

Req #	Priority	Requirement	Business Case
SIBSF017	High	Alternatively, users should be able to embed an image at the centre of the QR code itself.	A core differentiating feature of SoftInvitesQR.
Sharing, Payments & Guest Engagement			
SIBSF018	High	Users should be able to share QR codes via WhatsApp or email, depending on the guest's preferred channel.	Improves the overall user experience.
SIBSF019	High	A wallet feature should let users pay for the number of codes they want to generate.	Same as above.
SIBSF020	High	The profile page should capture first name, last name, phone number, country, state, and a "Save" action.	Same as above.
SIBSF021	Medium	Users should be able to change their email address.	Same as above.
SIBSF022	Medium	Users should be able to delete events and create multiple events.	Same as above.
SIBSF023	Medium	SoftInvitesQR should include a Help Centre covering how the product works, terms of use and privacy policy.	Improves the overall user experience.
SIBSF024	High	An Activity page should show the user how many codes have been generated.	Keeps users informed of usage / spend to date.
SIBSF025	Medium	A payment gateway should support multiple currencies.	Lets users pay from anywhere in the world.
SIBSF026	Medium	The guest landing page should show Search, Discover, Login and Create Event icons in the menu bar.	This is the first page a guest sees when visiting the site.
SIBSF027	Medium	Users should be able to see how many codes were scanned, and when.	Lets the user track event attendance.
SIBSF028	Medium	A Ticket action should let users sell event tickets and generate a unique QR code per attendee.	An additional monetisation feature for SoftInvitesQR.
SIBSF029	High	The ticketing interface should support both free and paid events.	Same as above.
SIBSF031	High	The platform should charge hosting fees for both free and paid events.	Same as above.
SIBSF032	High	Users should be able to generate a shareable link that lets guests fill in their details and download their own QR code.	Important for tracking registrations / pledges.
SIBSF034	Medium	A creator's dashboard should show stats, event titles and wallet balance.	Gives creators visibility into how their event is performing.
Check-in / Scanning			
SIBSF053	High	A code can be scanned once only; a second scan attempt returns an "Invalid" error.	Improves the overall user experience.
Security Requirements			
SIBS-S001	High	SoftInvitesQR can only be accessed using the login details created at registration.	Ensures the application can only be accessed by an authorised user.
SIBS-S002	High	User passwords must be stored and protected securely.	Helps protect the system against unauthorised access.
SIBS-S003	High	A notification is sent to the user's email each time they	Same as above.

Req #	Priority	Requirement	Business Case
		log in.	
Reporting & Admin Dashboard			
SIBS-R001	High	The admin home page should display the number of events created.	Provides usage statistics.
SIBS-R002	High	The admin home page should display the number of new sign-ups.	Helps monitor the influx of users.
SIBS-R003	High	The admin home page should display the most recent events at any point in time.	Provides statistics on newly added events.
SIBS-R004	High	The admin home page should display information about the top creator.	Same as above.
SIBS-R005	Medium	The admin home page should display transactions such as paid events, fees accrued from codes generated, and coupons.	Same as above.
SIBS-R006	Medium	The admin home page should display a list of event categories at any point in time.	Same as above.
SIBS-R007	High	The creators page should show name, email, number of events, total earnings, date joined and actions.	Supports easy collation of creator information.
SIBS-R008	High	An admin should be able to filter creator information.	Same as above.
SIBS-R009	High	An admin should be able to export creator information.	Same as above.
SIBS-R010	High	An admin should be able to create events and apply a coupon code to change payments for a specific event.	Used when the admin is offering a discount.
SIBS-R011	High	Clicking a creator's name should display overview, profile, events, payments and transactions.	Same as above.
SIBS-R012	High	The users page should show name, email, date joined and actions.	Supports easy collation of user information.
SIBS-R013	High	An admin should be able to assign sub-admins.	Same as above.
SIBS-R014	High	An admin should be able to export creator information.	Same as above.
SIBS-R015	Medium	Under a creator's account, all their projects should be listed, each with an overview, generated codes and transactions.	Same as above.
SIBS-R016	High	The Finance module should display total codes generated, withdrawals, earnings and income.	Provides up-to-date financial information on the SoftInvitesQR platform.
SIBS-R017	High	The Finance module should display the most recent transactions.	Same as above.
SIBS-R018	High	An admin should be able to filter and export data on the finance page.	Same as above.
SIBS-R019	Medium	The finance table should display name, email, date joined and actions.	Same as above.
SIBS-R020	Medium	The Settings module should cover Profile, Payments, Events, Transactions, Security/Login, Notifications and Integrations.	Lets admins configure SoftInvitesQR.

Req #	Priority	Requirement	Business Case
SIBS-R021	Medium	The Reports module should display total sign-ups, creators, projects, completed events, payments, coupons, projected earnings and income.	Gives an admin a detailed analysis of key data.
SIBS-R022	High	An admin should be able to filter and export reports.	Same as above.
SIBS-R023	High	The role management page should display the different admin roles and admin users.	Important for managing roles and permissions.
SIBS-R024	Medium	Role management should let the super admin divide tasks by responsibility level, showing each role and how many users are assigned to it; visible to super admins only.	Same as above.
SIBS-R025	High	An admin should be able to add roles and manage access.	Same as above.
SIBS-R026	Medium	An admin should be able to filter support tickets.	Lets an admin see and respond to complaints via chat, and close or resolve raised issues.
SIBS-R027	High	The support ticket page should include a system to view and respond to user complaints.	Same as above.
SIBS-R028	Medium	The support ticket module should be split into open and resolved tickets.	Same as above.
SIBS-R029	Medium	The support ticket page should display ticket ID, ticket title, client name, status and date.	Same as above.
SIBS-R030	Medium	Clicking a ticket should open a page showing the user's complaint, where an admin can respond to the ticket.	Same as above.
Usability Requirements			
SIBS-U001	High	Each user shall be registered to use the application.	Core to what SoftInvitesQR is about.
SIBS-U002	High	Users should not need to log in every time they access the application after initial sign-up; SoftInvitesQR should remember a user's sign-up session.	Same as above.
SIBS-U003	High	Users should be able to browse content according to the classifications provided.	Same as above.
SIBS-U004	High	Each user must provide email and phone number details upon registration and sign-up.	Same as above.
SIBS-U005	High	The web app's interface shall be responsive, displaying correctly on tablet, laptop and desktop devices.	Makes access easy and smooth on any platform.
SIBS-U006	High	The interface, database performance and query processing time should be capable of ongoing improvement.	Ensures the application works efficiently.
SIBS-U007	High	The user should be able to access content.	An important source of user feedback.
Audit Requirements			
SIBS-A001	High	The system should implement audit-log procedures to automatically review reports and system activity.	Helps maintain system reliability.
SIBS-A002	High	The system should be designed so administrators can	Supports record-keeping.

Req #	Priority	Requirement	Business Case
		identify user inactivity (a user not having used the app for an extended period).	

B.1 Non-Functional Requirements

ID	Requirement
NFR-001	SoftInvitesQR should support many concurrent users without issue; volume and stress testing shall be performed prior to launch.
NFR-002	Usability will be measured and is expected to compete with globally rated apps, or better.
NFR-003	The app must be easy to use, uncomplicated, responsive and always available.
NFR-004	Performance must be uniform and standard regardless of version, operating system or platform.
NFR-005	The web app shall be available online within the brand, while the scanning feature shall be available to anyone on all mobile devices (iOS, Android, etc.).
NFR-006	The mobile version shall be compatible with all popular devices, particularly iPad (optimised for all screen sizes), Android tablets and smartphones.
NFR-007	The web app shall be optimised for monitors with screen sizes from 13" to 17".

B.2 Appendix — List of Acronyms

Abbreviation	Term
QR	Quick Response
Tech	Technology

B.3 Appendix — Glossary of Terms

Term	Definition
Innovation	An idea that has been transformed into practical reality.
User	Someone who interacts with the system.
Admin / Administrator	A system administrator given specific permissions for managing and controlling the system.
Web App	A software platform available on computer / desktop devices.

B.4 Original Functional Scope (Summary)

For quick reference, the table below summarises the detailed requirements above by functional area.

Area	Original Requirement
Platform access	Web-based application accessible on laptops and mobile devices, with responsive support for tablets and smartphones.
Event management	Create, delete and manage multiple events, with event information such as name, location, date and description.
Guest management	Manually add guests or import guest lists, with guest name, contact details and event-

Area	Original Requirement
	related categories / labels.
QR / access credentials	Generate unique QR codes for individual guests, categories or the full guest list; codes were specified as one-time use.
Invitation customisation	Import invitation artwork and embed or customise QR codes.
Communication	Share QR passes through WhatsApp or email.
Check-in	Scan QR codes and record whether codes have been used, including scan information.
Security	Login credentials, password protection and authorised-user access.
Reporting	Dashboard and reporting requirements covering events, guests, codes, activity and administrative information.
Responsive design	Support for mobile devices, tablets, laptops and desktop environments.

PART C — Product Evolution & Current State

The production product did not remain identical to the original specification. As the system was implemented and used operationally, requirements were refined and additional capabilities were introduced. Rather than treating these changes as inconsistencies, this case study records them as part of the natural product lifecycle.

C.1 Product Evolution During Implementation

Area	Original Position	Current / Evolved Position
Access model	Original specification included broader registration and creator-facing functionality.	Current system is used internally through administrator login details.
Device accessibility	Web and mobile-responsive requirements were specified.	The production interface is accessible on mobile devices and tablets as part of operational use.
Event lifecycle	Original document supported event creation and multiple events.	Current system groups events into All, Active and Expired views.
Guest operations	Guest creation / import and QR generation were specified.	Current system provides a dedicated guest-management workflow with bulk import, guest creation, QR downloads and reports.
RSVP	Not explicitly represented as a current RSVP workflow in the original FRD.	Current product provides RSVP links, RSVP administration, attendance responses and RSVP tracking.
Communication	Original FRD specified WhatsApp and email sharing.	Current product supports WhatsApp and email; SMS is being implemented.
RSVP responses	Not explicitly specified in the original FRD.	Current workflow includes 'Yes, I'll attend' and 'Unable to attend' responses.
Analytics	Original specification included scan analysis and administrative reporting.	Current portal provides event, guest, check-in, RSVP and communication metrics and analytics.
WhatsApp responses	Not explicitly described as a full operational workspace in the original FRD.	Current portal includes a WhatsApp Replies workspace for reviewing guest responses.
Reporting / export	Original requirements included reporting and activity information.	Current product supports guest / report exports and RSVP report generation.

C.2 Current Product Specification — Admin Portal

The current SoftInvites Admin Portal is organised around several operational modules.

Current Module	Function
Dashboard	Real-time event, guest, check-in and unused-code metrics, together with check-in trends.
Events Management	Event actions include RSVP access, guest access, editing, WhatsApp replies, deletion and link generation.
Guest Management	Create / import guests, resend communications, download QR passes, export reports and scan guests.
RSVP Management	Manage RSVP guests, create / import RSVP records, configure forms, customise attendance questions, build messages, schedule communications and monitor responses.

Current Module	Function
Communication	WhatsApp and email are operational; SMS is in progress.
Analytics & Reporting	KPIs, response distributions, delivery metrics, engagement information and report / export functions.
WhatsApp Replies	Review incoming guest responses and chat histories through an interaction workspace.
Enquiries	Manage public enquiries, filter statuses and export enquiry information.
Administration & Security	Administrator access, password management and profile controls.

C.3 End-to-End Product Journey

The product can now be understood as an operational journey rather than a collection of separate features:

1. Create and configure an event
2. Add or import the guest list
3. Generate unique guest access credentials / QR passes
4. Create or configure the RSVP experience
5. Disseminate invitations and RSVP communications through available channels
6. Receive and track RSVP responses
7. Manage guest information and communication responses
8. Validate guests at the venue through QR scanning
9. Monitor attendance, RSVP and communication metrics
10. Export reports and review event outcomes

C.4 Requirements-to-Product Thinking

A key product-management lesson from SoftInvites is that requirements are not necessarily static. The original FRD established the functional foundation, while operational use exposed additional needs and led to changes in the product. For portfolio purposes, this demonstrates a lifecycle of requirements definition, development, feedback, refinement and continued delivery.

For example, the original FRD specified WhatsApp and email sharing of QR codes. The current product has expanded the communication workflow into a broader multichannel process, with SMS currently in progress. Similarly, RSVP is now a central workflow with configurable forms, response tracking and communication automation, although that current workflow is not explicitly described in the original FRD. The original FRD's QR, one-time-use and scanning requirements provide the foundation for the current access and check-in process.

PART D — Portfolio Materials

D.1 Product Owner / Business Analysis Contribution

For a professional portfolio, the strongest story is not simply that SoftInvites has a working product. The case study demonstrates involvement across the business, product, technology and operational layers.

Capability	Evidence in the SoftInvites Case Study
Business understanding	Identified and translated operational event-management needs into product requirements.
Requirements	Worked with BRD/FRD documentation to define expected product behaviour and functionality.
Product evolution	Refined requirements as implementation and real-world use exposed new or changed needs.
User experience	Considered how event administrators and guest-facing RSVP interactions should work.
Operations	Connected the product to real event workflows including guest communication, RSVP and venue check-in.
Data	Worked with guest, RSVP, attendance and communication information to support reporting and operational decisions.
Technology collaboration	Translated business needs into functional requirements that could be implemented by the technology team.

D.2 Portfolio Case Study — Narrative Draft

SoftInvites: Evolving an Event Guest Management Platform

I worked on SoftInvites as an event and guest management product, translating operational requirements into a digital workflow for managing events, guests, invitations, RSVP and venue check-in.

The product started with a requirements specification focused on event creation, guest-list management and unique QR-based access. The original functional specification also covered one-time codes, QR scanning, invitation sharing, security, reporting and responsive access across devices.

As the product moved into implementation and operational use, the requirements evolved. The system became an internal Admin Portal, the interface was made usable across mobile and tablet devices, and the event workflow developed into All, Active and Expired event views. RSVP became a significant part of the product, allowing event teams to generate RSVP links, request attendance confirmation, track responses and manage communications.

The communication workflow also expanded. WhatsApp and email are currently available, while SMS is in progress. The current portal brings guest management, RSVP administration, communication, check-in and reporting into a more integrated operational workflow.

The main product lesson for me was that requirements do not stop at the point where a BRD or FRD is written. Real users and operational conditions can reveal new requirements, clarify existing ones and change priorities. SoftInvites gave me practical experience of taking a business need through requirements, functional specification, implementation, iteration and operational use.

D.3 Evidence to Show in the Portfolio

- An anonymised product overview / system map
- A simplified requirements-to-feature mapping
- Selected anonymised BRD/FRD excerpts
- Screenshots of the current Admin Portal, with confidential information removed
- An RSVP workflow diagram
- An event-to-check-in process flow
- A product evolution timeline
- An example of a requirement that changed during implementation
- An analytics / reporting example using anonymised or synthetic data

D.4 Confidentiality & Portfolio Presentation

The portfolio version should not expose client names, guest contact details, real event information, login credentials, private links, phone numbers, email addresses or other operationally sensitive information. Screenshots should be cropped or anonymised, and examples of guest or event data should use synthetic values where necessary.

D.5 What to Build Next

1. A polished one-page Product Case Study for the portfolio
2. A product evolution timeline showing the journey from original specification to current product
3. A requirements-to-feature matrix based on the actual BRD/FRD
4. A simple product architecture / workflow diagram
5. A separate data and analytics case study using SoftInvites operational data
6. A portfolio-ready presentation of the evidence without exposing confidential information
